

Which tests are not reimbursed ?

This applies only to patients being followed-up in France

Some tests are important for your follow-up care but may not always be covered by the Sécurité Sociale or insurance unless clearly marked on your prescription.

- **Vitamin D (25 OH)**

This test is essential but might not be reimbursed unless it is clearly written on your prescription and flagged to the laboratory.

Be sure your doctor notes “reimbursable” on the prescription and that you inform the lab.

- **24-hour urinary urea**

This test can help assess your protein intake and dietary balance, though it is not always required.

It’s often not reimbursed, and your doctor will advise whether it’s useful based on your individual case (especially if you’ve had kidney stones or dietary concerns).

- **Ionised calcium**

This blood test is rarely useful in routine monitoring and is generally not reimbursed.

It requires immediate analysis, which is difficult outside of a hospital setting — results can change if not processed right away.
